

PRODUCTION OF FREE FATTY ACIDS FROM TRAP GREASE WASTE

Envitop Ltd (Finland) has developed the **TOPGREASE** -process to separate and recycle fatty acids from brown grease, waste collected from grease traps. The product is a free fatty acid solution.

Trap grease waste consists of emulsified and saponified fatty acids (5-15%), water (85-95%) and solids (1-3%). Trap grease waste is formed especially in the food industry and restaurants.

The produced free fatty acid solution can be used directly in modern burners (contains 32-37 MJ/kg of energy) or processed further in industry.

We offer process design, construction and implementation.
